PHASE 3 – Project Design Phase

Cricket Player Performance Tracking Application: CRICKSTATS

Problem–Solution Fit

The design maps the identified cricket performance tracking problems to a centralized Salesforce solution.

Proposed Solution

CRICKSTATS provides custom Salesforce objects for player and match performance data, connected through relationships and supported by automation, reports and dashboards.

System Architecture

The architecture is organized into Presentation, Application, Data and Analytics layers.

Presentation Layer

Provides the user-facing Salesforce interface for entering and viewing information.

Application Layer

Handles application logic and automation using Salesforce features and Flow.

Data Layer

Stores player and match performance records using Salesforce objects and fields.

Analytics Layer

Provides reports, dashboards and summarized performance information.

Data Relationships

Player and Match Performance information are linked so that match-wise data can contribute to player-level performance summaries.
