PHASE 5 – Project Development Phase

Cricket Player Performance Tracking Application: CRICKSTATS

Development Overview

The CRICKSTATS application is developed on Salesforce using custom objects, fields, relationships, roll-up summaries, Flow automation, reports and dashboards.

Player Object

The Player object stores player-related information and supports organized player registration and tracking.

Match Performance Object

The Match Performance object stores match-wise performance information for players.

Custom Fields

Fields are configured according to the project requirements to capture player and performance details.

Relationships

Relationships connect performance records with the relevant player records.

Roll-Up Summary

Roll-up summary fields are used to derive player-level totals or summarized performance values from related performance records.

Flow Automation

Salesforce Flow is used to automate supported processes and reduce repetitive manual work.

Analytics

Reports and dashboards provide summarized information for reviewing player performance.
